

EXADS Bootcamp FE Candidate Exercise

Business Context

One of our teams at Exogroup is looking to create a few different landing pages for some internal projects. These will require the development of interactive landing pages where the end user will be answering a small questionnaire and be redirected to a specific web page in the end.

What will we evaluate

- Correct implementation of required features and overall UI / UX
- Use of the right tools and technologies to achieve the end result
- Good coding practices are followed
- Overall flexibility, maintainability, performance and scalability of the code

Requirements

The goal of this exercise is to mimic the behavior of the following mockups into an actual web page which the end user can interact with. Make sure to login to Figma for easier exporting of the required images and details.

- Figma File: [Bootcamp FE Candidate Exercise Mockups](#)
- Figma Prototype: [Bootcamp FE Candidate Exercise Prototype](#)
- Example video: [Bootcamp FE Candidate Exercise Video](#)

The list of options to choose must be configurable as to allow the answers from previous questions to impact the options displayed in the next question (*). Example.:

- If the user selects "The Gray Man" in question 1, he is presented with "Top Gun: Maverick", "Bullet Train" and "Thor: Love and Thunder" movies in question 2.
- If the user selects "Blonde" in question 1, then he is presented with "Purple Hearts", "Black Panther: Wakanda Forever" and "The Godfather" movies in question 2.

In the final page with the CTA button "Watch here!", when a user clicks on it, he must be redirected to the corresponding IMDB page for the last chosen movie.

(*) The final list of movies to use can be one of your own choosing.
